Conflict of interest	N	Explanation	

1	Open comments box	The natural question is: why are the four routines benchmarked across reservoirs located in the United States? The natural reply will be that US reservoirs are very well described and very well managed with an abundance of data and information. But on the other hand they represent a very small minority of the world reservoirs (less than 1%), the majority of which may be poorly managed, and with few data available. I understand a general purpose routine is sought, despite the enormous difficulties to overcome to make it. How to solve this dilemma, I am afraid, is up to you to answer. Scientific articles submitted to peer-reviewed journals undergo a JERB editorial review to check overall quality and scope. If suitable, they are authorized to proceed to the journal peer review, where experts evaluate their validity, methodology, and scientific value.
